Dark Field Microscopy

Learning from your blood

Live cell analysis is an educational opportunity offered by our office. A drop of your blood is placed on a slide and projected through a dark field microscope. Unlike blood tests designed for diagnosing disease, your cells are displayed in their living state on a video monitor for you to watch and learn from.

You will see and learn about red blood cells, immune system white blood cells, fibrinogen and platelets. The information gathered in this blood analysis is not a replacement for blood tests. It is not used for diagnosis. Rather, it is an opportunity to learn about your body in a unique way. This can help you to appreciate the amazing complexity of your body and promote self-awareness as well as conscious good health. No reports can be generated from this experience for medical use.

I have read the above and agree to use this educational opportunity.
